PC-Speed Internal Emulator $369.95

Turns Your ST Into FAST PC Clone... Now Shipping, Too!

PC-Speed is the internal PC/XT/AT emulator you never heard of but that is available for shipping NOW! It runs MS-DOS 3.2 or higher on your Atari ST and it runs FAST... some say faster than *PC-Ditto II* in certain of the benchmark Norton ratings. It works with all Atari STs and Megas, color or monochrome. Installed, it sits on top of the 68000 chip... which may conflict with some Ram expansion units such as our original ST Solderless RAM. With the sheet metal RF shield removed (perhaps replaced with a lighter shield of plastic insulated foil) the *PC-Speed* unit seems to fit under that RAM. At this time, we haven't evaluated whether this is good to do with regard to heat buildup, the effect of the two pressing against each other, or the potential for shorting

MultiSynch Monitor Adaptor $59.95

Run All Three Rez On One MultiSynch Monitor

Order #280-758 See Page 6

"Michtron's Best" Game Blowout

Rock Bottom Prices On Greats Like Time Bandit, International Soccer, Airball,...More!

See Page 6

VIDI-ST Digitizer $149.95

Freeze-Frame Video Digitizer From Scotland

See Page 15

Installation of *PC-Speed* requires soldering a piggy-back socket to the 68000 microprocessor. The *PC-Speed* board then plugs into this socket. Illustrated instructions are provided in German along with a photocopied English translation. It's pretty straight forward, but if you have any qualms about soldering or opening your computercase, you may want an expert to do it for you. We can accept no liability for damage to your computer or the *PC-Speed* device from static discharge or poor soldering technique.

Once installed, *PC-Speed* springs into action when a PC_SPEED.PRG is run. Like *PC-Ditto*, the computer asks for a DOS disk. You insert DOS version 3.2 or higher, press return, and soon see the familiar "A>" DOS prompt that appears on all PC-Compatibles. At this point, your ST is no longer an ST... it is a real, FULL SPEED PC Compatible.

If you'd like your Atari ST to emulate a full speed PC-Compatible, *PC-Speed* is for you.

Breakthrough Technology

DC Utilities Package Offers Features That Will Surprise And Delight You

Mini-Review by Eben Brown

I just happened to be reading an article about him when Michael Vederman called to tell me about his new *DC Utilities* package. Another "Utilities" disk, you say? No way! I haven't seen stuff like this on anybody's utility disk before. Six great utilities for your Atari ST... Check 'em out:

DC Squish

Squish compacts all of your programs and desk accessories for faster loading and memory savings. It'll even reduce your boot-up time by compacting your AUTO file programs for faster loading.

DC DESKEY 2.0

Assign keystrokes to GEM drop down menus in any GEM program. Now you can press a key to do the same thing as selecting menu items with a mouse. Over 2000 possible key combinations give you plenty of flexibility. (By the way, our FunctionZ Key Label Kit goes nicely with *DESKEY 2.0*).

DC Xtract

Only 12K in size, this super fast, pure assembly desk accessory lets you Xtract, list, or test the contents of any .ARC file... FOUR TIMES FASTER THAN EVER BEFORE POSSIBLE!

DC Sea

SEA (Self Extracting ARC) allows you to make a program that will extract or list its own ARC contents... actually creates programs from ARC files!

DC RAMIT

A formattable, reset-proof RAM disk. Formattability allows it to imitate an actual floppy for fast virtual disk copies. Also, the entire contents can be saved as one file for quick loading of the same contents on boot-up.

DC DSKORG

Now you can change from DESKTOP.INF files with a sinple double click of our mouse. Store several DESKTOP preferences and change at will! No rebooting required.

As you can see *DC Utilities* is really something! Not only breakthrough technology, but a way to enhance your Atari ST's performance without a huge expense! Order your's today!

Spectre GCR Mac Plus Emulator

Turns Your ST Into FAST Macintosh Plus... Uses ST Floppy!

Turn your Atari ST into a Macintosh Plus with the all new *Spectre GCR* cartridge and a set of Macintosh ROMs. It's quick, easy, and economical.

For those who haven't followed the development of an ST Macintosh emulator, *Spectre GCR* is the fruit of several years labor. It began as a device called "Magic Sac" which used the older ROMs and needed a very slow "Translator" device to read Macintosh disks. Then *Spectre 128* was introduced which used the more powerful 128K Mac ROMs but still couldn't direct read Mac disks. The new *Spectre GCR* gives all of the advantages of the new ROMs plus the ability to directly read Mac disks at acceptable speed. In fact, an Atari St equipped with *Spectre GCR* is actually faster than a Macintosh Plus!

Spectre GCR is a cartridge that plugs into your Atari ST cartridge port. You install a set of Macintosh Plus ROMs (available separately) in the cartridge, plug it into your ST, plug an ST disk drive into the cartridge, and you're ready to go. You run the Spectre program and your ST becomes a Macintosh. The *Spectre GCR* cartridge automatically takes care of reading/writing the GCR format Macintosh disks in your drive... as well as allows ST disks to be read and written to. Best of all, you can run virtually any Macintosh Plus software!

Spectre GCR is the clean, simple ready-to-go Macintosh emulator you've been waiting for. Order your's and a set of Mac ROMs today!
